5hrs

STEVE： 12 months of inactivity could＇ve resulted in corrosion，but because preservation oil was kept in place until the first run，no significant corrosion formed．It shows up as aluminum and iron in testing，and both metals are appropriately low．There＇s probably some wearing in left to do，so we won＇t be surprised if copper and silicon stay high for a while－from bronze parts building clearances and sealers．By the time the engine has $\sim 100$ hours on it，the results should look more like universal averages（based on $\sim 35$ hours）．
The viscosity is a bit low for 100，and that＇s okay．
